Module 1 Verification

Hello world app up and running

The screenshot displays a code editor with a file named `app.py` and a terminal window below it. The code in `app.py` is a simple Flask application that returns "Hello, Welcome to My Personal Website!" at the root URL. The terminal shows the command `flask --help` being executed, followed by the command `python3 app.py` which starts the development server. The terminal output includes a warning about using the development server in production and shows the server running on `http://127.0.0.1:8080` and `http://192.168.7.112:8080`. It also shows the server restarting with `stat` and the debugger being active.

```
Welcome x module1_solution.py x app.py 2 x

1 '''Base application for the a Flask-based personal website.'''
2
3 from flask import Flask
4
5 app = Flask(__name__)
6
7 @app.route("/")
8 def home():
9     return "Hello, Welcome to My Personal Website!"
10
11 if __name__ == "__main__":
12     app.run(host="0.0.0.0", port=8080, debug=True)

Problems 4 Output Debug Console Terminal Ports
(venv) Joshs-MacBook-Pro:flask_personal_site jjlatz$ flask --help
directory.

Options:
  -e, --env-file FILE      Load environment variables from this file, taking
                           precedence over those set by '.env' and '.flaskenv'.
                           Variables set directly in the environment take highest
                           precedence. python-dotenv must be installed.
  -A, --app IMPORT         The Flask application or factory function to load, in
                           the form 'module:name'. Module can be a dotted import
                           or file path. Name is not required if it is 'app',
                           'application', 'create_app', or 'make_app', and can be
                           'name(args)' to pass arguments.
  --debug / --no-debug    Set debug mode.
  --version               Show the Flask version.
  --help                  Show this message and exit.

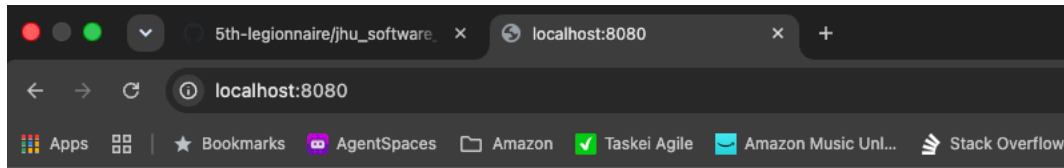

Commands:
  routes                  Show the routes for the app.
  run                     Run a development server.
  shell                  Run a shell in the app context.

Welcome to My Personal Website!

Hello! My name is **Josh Latz**, and I am currently the **Vice President of Delivery Engineering and AI Enablement at Virtru**. I have a passion for technology and enjoy working on innovative projects that make a difference.

A little bit more about me: In my current role which I just began on 8/31/2026, I lead the teams that put data-centric security in customers' hands. Prior to that, I spent nearly a decade at Amazon, most recently as a Senior Software Development Manager in Amazon Security running a 50-engineer organization behind the authorization control plane, with earlier stops in data science and data engineering, software development, technical product management, program management, and business development across different service and business domains within AWS and defense tech. Before tech, I served in U.S. Army Special Forces as a SOT-A team leader, serving in combat operations across 3 tours to Iraq and another as a contractor in Yemen. I hold a Georgetown Executive MBA and I'm pursuing an MS in AI at Johns Hopkins.

Feel free to explore my website to learn more about my work, interests, and experiences.

Projects and Publications

Here are some of my recent projects and publications at JHU in my MS in AI program:

- Module 1: Building a personal website.
- About module 1: This assignment will teach you the fundamentals of website construction. You will build a personal developer website that includes a biography, contact information/links, and details about your Python projects. This will give you a chance to both be creative and learn the fundamentals of website development. We will look back and update this website throughout the course as our set of Python projects grows. You will practice working with Flask, a micro web framework written in Python. You will first learn to work with HTML, and then you will learn to work with cascading style sheets (CSS) to describe how HTML elements are to be displayed. Your output should be a functional personal website that includes details about you, your projects, and contact information.
